

Database Collections Description

USER

Represents the individuals or organizations registered on the platform. It stores user profile information such as User ID, name, email address, encrypted password, contact details, shipping address, and account role. This collection is used for authentication, authorization, profile management, and order tracking.

Admin

Represents administrative data required to manage the platform. It stores information such as banner images, product categories, promotional content, and administrator credentials. Administrators use this collection to manage products, categories, offers, and website content.

Products

Represents the complete catalog of products available on the platform. Each product record includes Product ID, name, description, category, price, stock quantity, product images, ratings, and discount information. This collection is accessed whenever users browse, search, or purchase products.

Cart

Stores the products added to users' shopping carts before checkout. Each cart is associated with a specific User ID, ensuring every user has an independent cart. It records Product ID, quantity, subtotal, and the date items were added, allowing users to modify or remove products before placing an order.

Orders

Stores all orders placed by users. Each order contains Order ID, User ID, purchased products, quantities, total amount, payment method, shipping address, order date, and current order status. This collection supports order confirmation, tracking, and purchase history.
